

EN ROUTE CARE TRANSPORT TEAM

Last Updated: 5 April 2016

En route critical care transport capabilities consist of several specialized medical teams who assist in carrying out the mission of the global patient movement system. These teams are limited, rapidly-deployable resources available in selected situations to maintain or enhance the standard of care provided to critically ill or injured patients who require continuous stabilization and highly advanced care during transport to the next level of medical treatment. En route critical care units include critical care air transport team (CCATT), tactical critical care evacuation team (TC CET) and, special operations critical care evacuation teams (SOC CET). Other enabling capabilities include, but are not limited to, acute lung rescue teams, neonatal intensive care unit teams, and joint medical attendant transport teams. CCATTs and TC CETs provide intensive care, by themselves or in conjunction with aeromedical evacuation (AE) crews, to evacuate critical patients requiring advanced care during transportation. These teams are medically responsible for their patients.
